Probabilistic Robotics

Probabilistic Motion Models

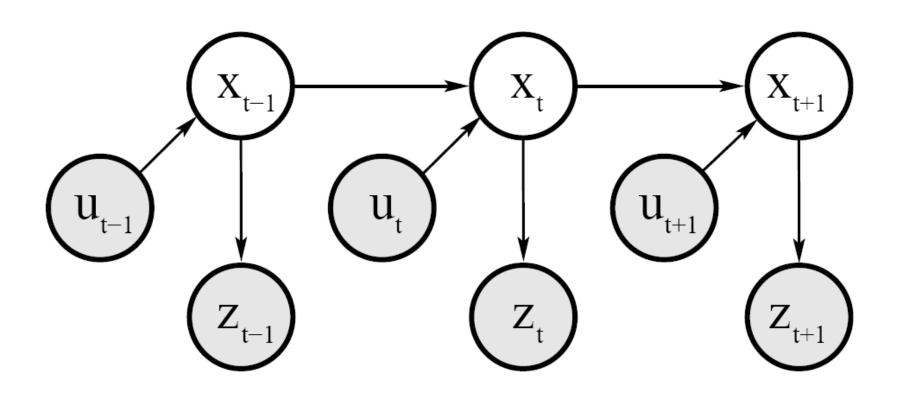

Robot Motion

- Robot motion is inherently uncertain.
- How can we model this uncertainty?

Dynamic Bayesian Network for Controls, States, and Sensations

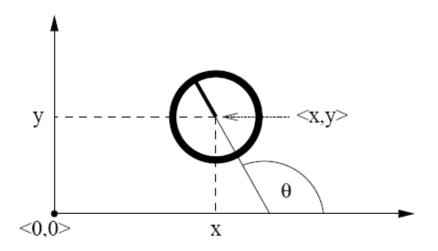

Probabilistic Motion Models

- To implement the Bayes Filter, we need the transition model $p(x \mid x', u)$.
- The term $p(x \mid x', u)$ specifies a posterior probability, that action u carries the robot from x' to x.
- In this section we will specify, how $p(x \mid x', u)$ can be modeled based on the motion equations.

Coordinate Systems

- In general the configuration of a robot can be described by six parameters.
- Three-dimensional cartesian coordinates plus three Euler angles pitch, roll, and tilt.
- Throughout this section, we consider robots operating on a planar surface.
- The state space of such systems is threedimensional (x,y,θ).

Typical Motion Models

- In practice, one often finds two types of motion models:
 - Odometry-based
 - Velocity-based (dead reckoning)
- Odometry-based models are used when systems are equipped with wheel encoders.
- Velocity-based models have to be applied when no wheel encoders are given.
- They calculate the new pose based on the velocities and the time elapsed.

Example Wheel Encoders

These modules require +5V and GND to power them, and provide a 0 to 5V output. They provide +5V output when they "see" white, and a 0V output when they "see" black.

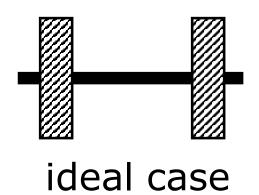

These disks are manufactured out of high quality laminated color plastic to offer a very crisp black to white transition. This enables a wheel encoder sensor to easily see the transitions.

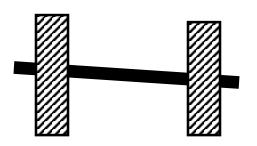

Source: http://www.active-robots.com/

Dead Reckoning

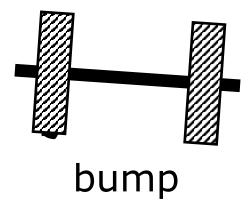

- Derived from "deduced reckoning."
- Mathematical procedure for determining the present location of a vehicle.
- Achieved by calculating the current pose of the vehicle based on its velocities and the time elapsed.

Reasons for Motion Errors

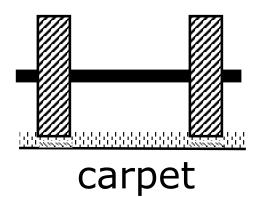

different wheel diameters

Odometry Model

- Robot moves from $\langle \overline{x}, \overline{y}, \overline{\theta} \rangle$ to $\langle \overline{x}', \overline{y}', \overline{\theta}' \rangle$.
- Odometry information $u = \langle \delta_{rot1}, \delta_{rot2}, \delta_{trans} \rangle$.

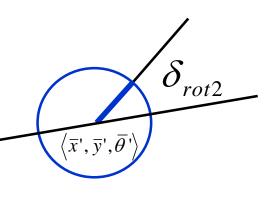

trans

$$\delta_{trans} = \sqrt{(\bar{x}' - \bar{x})^2 + (\bar{y}' - \bar{y})^2}$$

$$\delta_{rot1} = \operatorname{atan2}(\bar{y}' - \bar{y}, \bar{x}' - \bar{x}) - \bar{\theta}$$

$$\delta_{rot2} = \bar{\theta}' - \bar{\theta} - \delta_{rot1}$$

$$\delta_{rot2} = \overline{\theta}' - \overline{\theta} - \delta_{rot1}$$

$$\langle ar{x}, ar{y}, ar{ heta}
angle$$
 δ_{rot1}

The atan2 Function

 Extends the inverse tangent and correctly copes with the signs of x and y.

$$\operatorname{atan2}(y,x) \ = \begin{cases} \operatorname{atan}(y/x) & \text{if } x > 0 \\ \operatorname{sign}(y) \left(\pi - \operatorname{atan}(|y/x|)\right) & \text{if } x < 0 \\ 0 & \text{if } x = y = 0 \\ \operatorname{sign}(y) \pi/2 & \text{if } x = 0, y \neq 0 \end{cases}$$

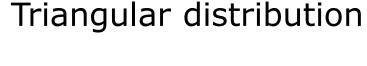

Noise Model for Odometry

 The measured motion is given by the true motion corrupted with noise.

$$\begin{split} \hat{\delta}_{rot1} &= \delta_{rot1} + \varepsilon_{\alpha_{1} | \delta_{rot1} | + \alpha_{2} | \delta_{trans} |} \\ \hat{\delta}_{trans} &= \delta_{trans} + \varepsilon_{\alpha_{3} | \delta_{trans} | + \alpha_{4} | \delta_{rot1} + \delta_{rot2} |} \\ \hat{\delta}_{rot2} &= \delta_{rot2} + \varepsilon_{\alpha_{1} | \delta_{rot2} | + \alpha_{2} | \delta_{trans} |} \end{split}$$

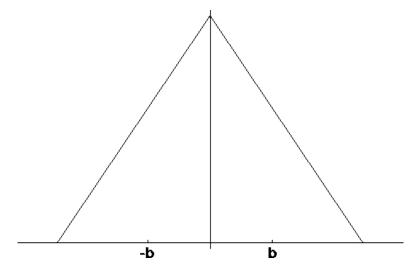

Typical Distributions for Probabilistic Motion Models

Normal distribution

$$\varepsilon_{\sigma^2}(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{1}{2}\frac{x^2}{\sigma^2}}$$

$$\varepsilon_{\sigma^{2}}(x) = \begin{cases} 0 \text{ if } |x| > \sqrt{6\sigma^{2}} \\ \frac{\sqrt{6\sigma^{2}} - |x|}{6\sigma^{2}} \end{cases}$$

Calculating the Probability (zero-centered)

- For a normal distribution
 - 1. Algorithm **prob_normal_distribution**(*a*,*b*):

2. return
$$\frac{1}{\sqrt{2\pi b^2}} \exp\left\{-\frac{1}{2}\frac{a^2}{b^2}\right\}$$

- For a triangular distribution
 - 1. Algorithm **prob_triangular_distribution**(*a*,*b*):
 - 2. **return** $\max \left\{ 0, \frac{1}{\sqrt{6} \ b} \frac{|a|}{6 \ b^2} \right\}$

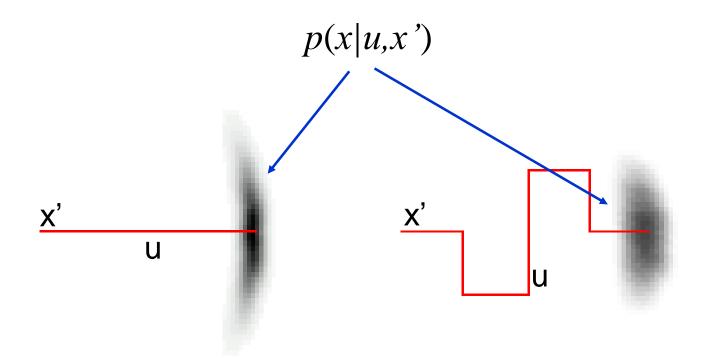

Calculating the Posterior Given x, x', and u

- Algorithm motion_model_odometry(x,x',u)
- 2. $\delta_{trans} = \sqrt{(\overline{x}' \overline{x})^2 + (\overline{y}' \overline{y})^2}$
- 3. $\delta_{rot} = atan2(\bar{y}' \bar{y}, \bar{x}' \bar{x}) \bar{\theta}$ odometry values (u)
- 4. $\delta_{rot2} = \overline{\theta}' \overline{\theta} \delta_{rot1}$
- 5. $\hat{\delta}_{trans} = \sqrt{(x'-x)^2 + (y'-y)^2}$
- 6. $\hat{\delta}_{rot1} = \operatorname{atan2}(y'-y, x'-x) \overline{\theta}$
- 7. $\hat{\delta}_{rot2} = \theta' \theta \hat{\delta}_{rot1}$
- 8. $p_1 = \text{prob}(\delta_{\text{rot1}} \hat{\delta}_{\text{rot1}}, \alpha_1 | \hat{\delta}_{\text{rot1}} | + \alpha_2 \hat{\delta}_{\text{trans}})$
- 9. $p_2 = \text{prob}(\delta_{\text{trans}} \hat{\delta}_{\text{trans}}, \alpha_3 \hat{\delta}_{\text{trans}} + \alpha_4 (|\hat{\delta}_{\text{rot}1}| + |\hat{\delta}_{\text{rot}2}|))$
- 10. $p_3 = \operatorname{prob}(\delta_{\text{rot}2} \hat{\delta}_{\text{rot}2}, \alpha_1 | \hat{\delta}_{\text{rot}2} | + \alpha_2 \hat{\delta}_{\text{trans}})$
- 11. return $p_1 \cdot p_2 \cdot p_3$

 \longrightarrow values of interest (x,x')

Application

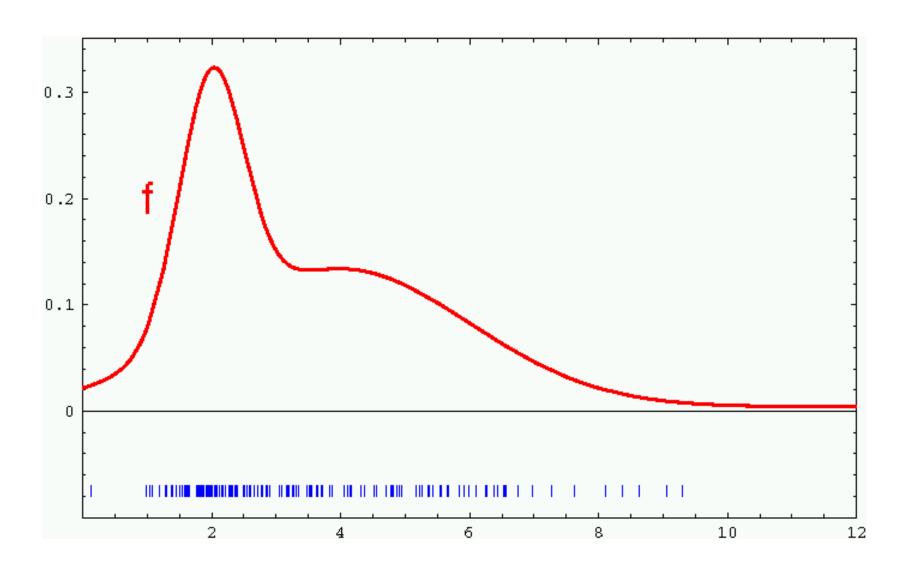

- Repeated application of the sensor model for short movements.
- Typical banana-shaped distributions obtained for 2d-projection of 3d posterior.

Sample-based Density Representation

Sample-based Density Representation

How to Sample from Normal or Triangular Distributions?

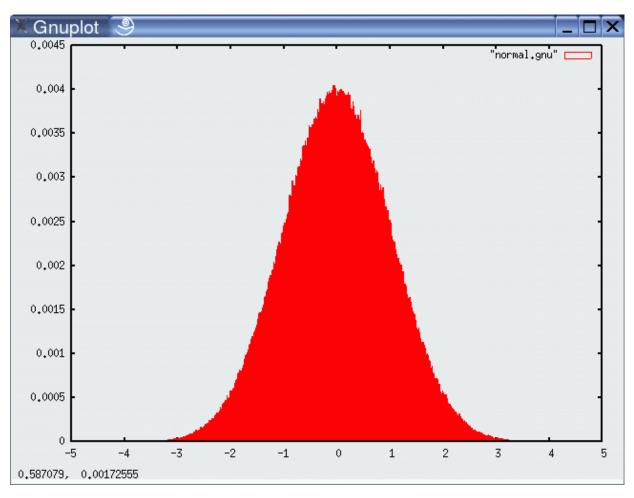

- Sampling from a normal distribution
 - 1. Algorithm **sample_normal_distribution(***b***)**:

2. return
$$\frac{1}{2} \sum_{i=1}^{12} rand(-b, b)$$

- Sampling from a triangular distribution
 - 1. Algorithm **sample_triangular_distribution(***b***)**:

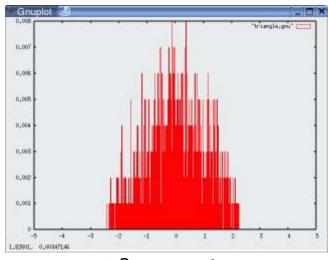

2. return
$$\frac{\sqrt{6}}{2} [\text{rand}(-b, b) + \text{rand}(-b, b)]$$

Normally Distributed Samples

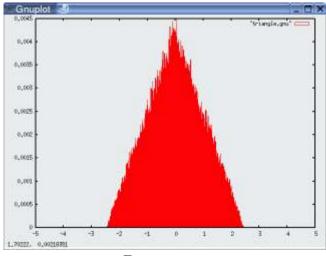

10⁶ samples

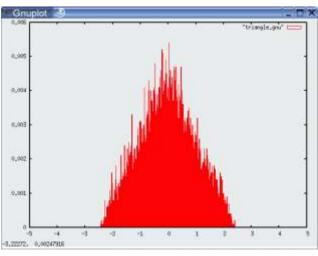

For Triangular Distribution

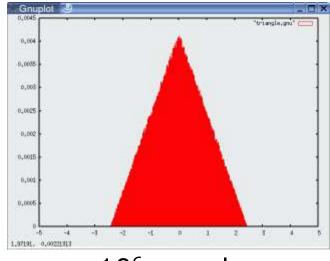

10³ samples

10⁵ samples

10⁴ samples

10⁶ samples

Rejection Sampling

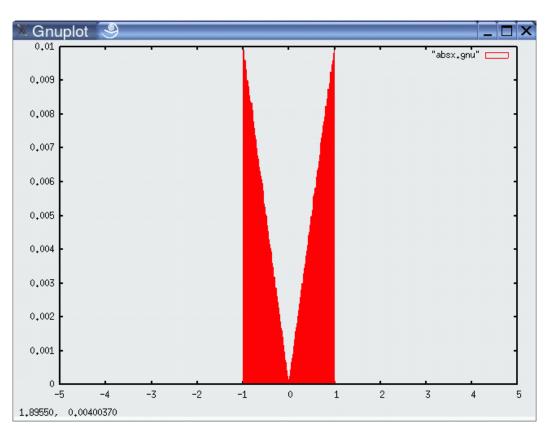

Sampling from arbitrary distributions

```
1. Algorithm sample_distribution(f,b):
2. repeat
3. x = \operatorname{rand}(-b, b)
4. y = \operatorname{rand}(0, \max\{f(x) \mid x \in (-b, b)\})
5. until (y \leq f(x))
6. return x
```

Example

Sampling from

$$f(x) = \begin{cases} abs(x) & x \in [-1; 1] \\ 0 & otherwise \end{cases}$$

Sample Odometry Motion Model

Algorithm sample_motion_model(u, x):

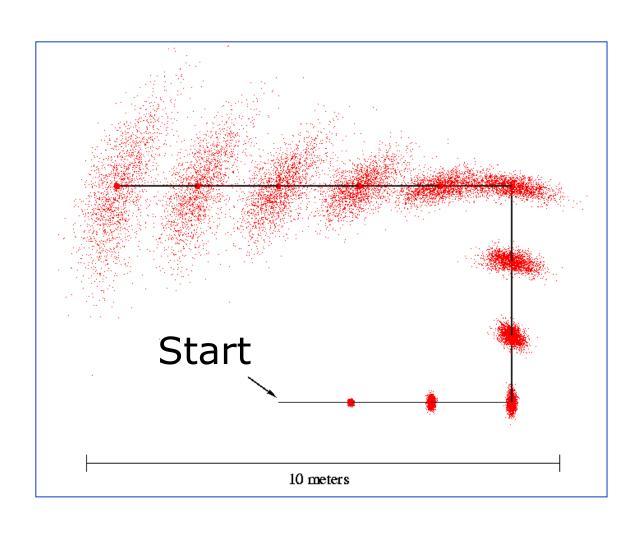

$$u = \langle \delta_{rot1}, \delta_{rot2}, \delta_{trans} \rangle, x = \langle x, y, \theta \rangle$$

- 1. $\hat{\delta}_{rot1} = \delta_{rot1} + \text{sample}(\alpha_1 | \delta_{rot1} | + \alpha_2 \delta_{trans})$
- 2. $\hat{\delta}_{trans} = \delta_{trans} + \text{sample}(\alpha_3 \delta_{trans} + \alpha_4 (|\delta_{rot1}| + |\delta_{rot2}|))$
- 3. $\hat{\delta}_{rot2} = \delta_{rot2} + \text{sample}(\alpha_1 | \delta_{rot2} | + \alpha_2 | \delta_{trans})$
- 4. $x' = x + \hat{\delta}_{trans} \cos(\theta + \hat{\delta}_{rot1})$
- 5. $y' = y + \hat{\delta}_{trans} \sin(\theta + \hat{\delta}_{rot1})$

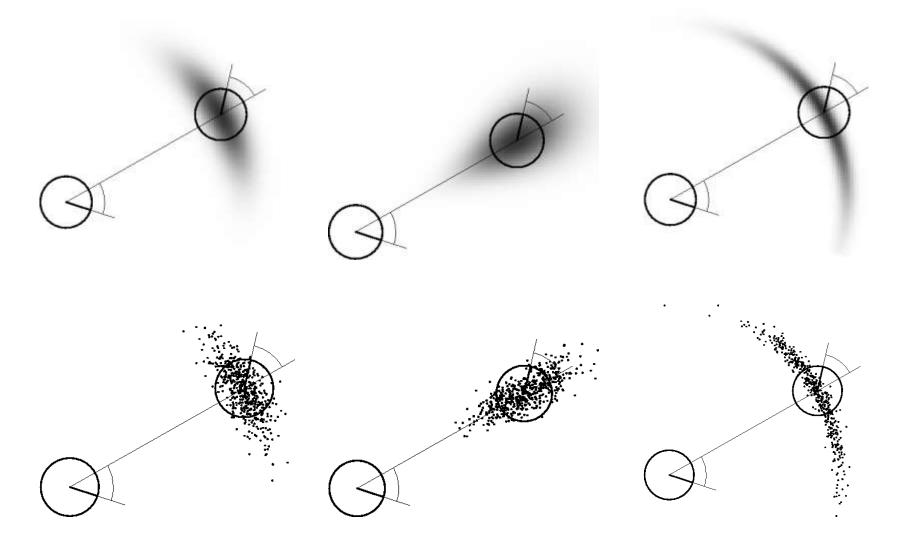

sample_normal_distribution

- 6. $\theta' = \theta + \hat{\delta}_{rot1} + \hat{\delta}_{rot2}$
- 7. Return $\langle x', y', \theta' \rangle$

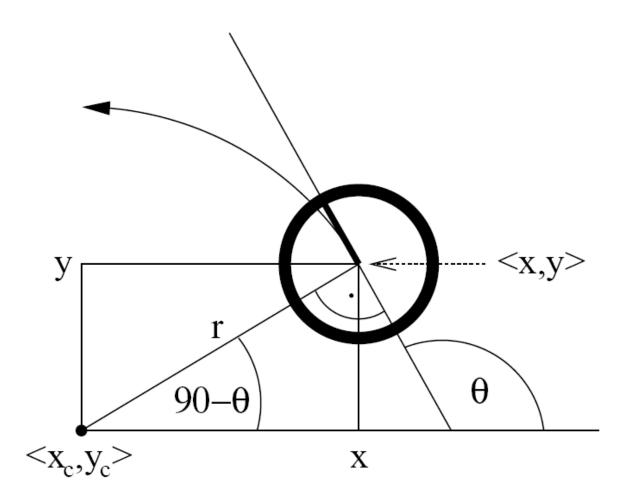

Sampling from Our Motion Model

Examples (Odometry-Based)

Velocity-Based Model

Equation for the Velocity Model

Center of circle:

$$\begin{pmatrix} x^* \\ y^* \end{pmatrix} = \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} -\lambda \sin \theta \\ \lambda \cos \theta \end{pmatrix} = \begin{pmatrix} \frac{x+x'}{2} + \mu(y-y') \\ \frac{y+y'}{2} + \mu(x'-x) \end{pmatrix}$$

with

$$\mu = \frac{1}{2} \frac{(x-x')\cos\theta + (y-y')\sin\theta}{(y-y')\cos\theta - (x-x')\sin\theta}$$

Posterior Probability for Velocity Model

Algorithm motion_model_velocity(x_t, u_t, x_{t-1}): 1: $\mu = \frac{1}{2} \frac{(x - x')\cos\theta + (y - y')\sin\theta}{(y - y')\cos\theta - (x - x')\sin\theta}$ 2: $x^* = \frac{x + x'}{2} + \mu(y - y')$ 3: $y^* = \frac{y + y'}{2} + \mu(x' - x)$ 4: $r^* = \sqrt{(x-x^*)^2 + (y-y^*)^2}$ 5: $\Delta \theta = \text{atan2}(y' - y^*, x' - x^*) - \text{atan2}(y - y^*, x - x^*)$ 6: $\hat{v} = \frac{\Delta \theta}{\Delta t} r^*$ 7: $\hat{\omega} = \frac{\Delta \theta}{\Delta t}$ 8: $\hat{\gamma} = \frac{\theta' - \theta}{\Delta t} - \hat{\omega}$ 9: return $\operatorname{prob}(v-\hat{v},\alpha_1|v|+\alpha_2|\omega|) \cdot \operatorname{prob}(\omega-\hat{\omega},\alpha_3|v|+\alpha_4|\omega|)$ 10: $\cdot \operatorname{\mathbf{prob}}(\hat{\gamma}, \alpha_5|v| + \alpha_6|\omega|)$

29

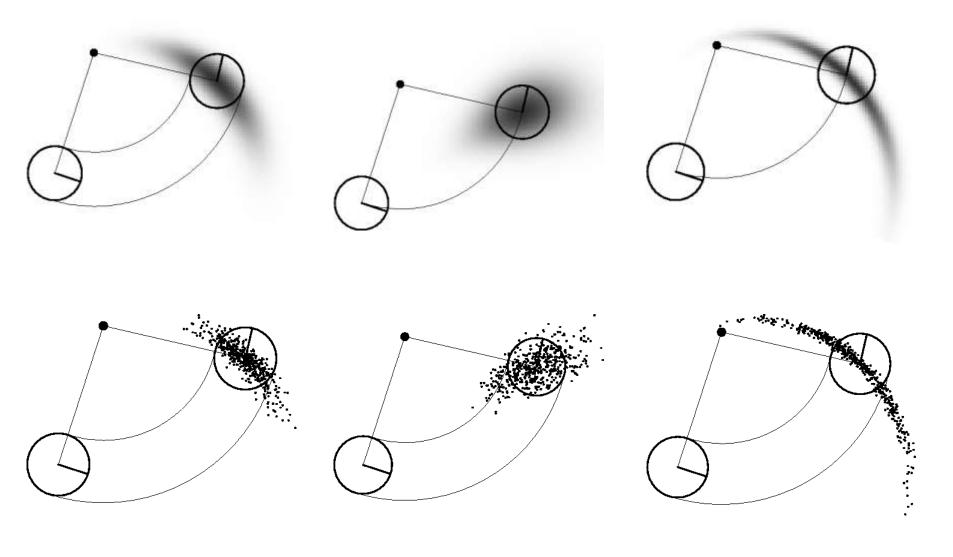

Sampling from Velocity Model

1: Algorithm sample_motion_model_velocity(u_t, x_{t-1}):

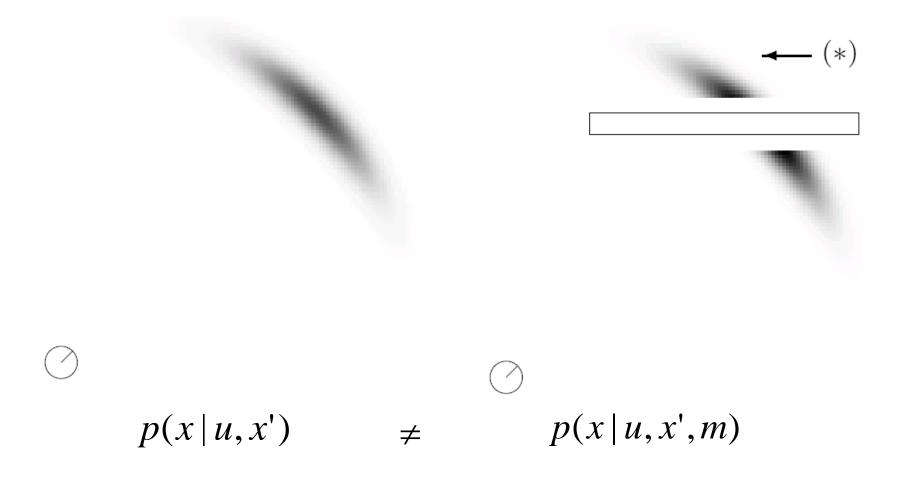

2:
$$\hat{v} = v + \mathbf{sample}(\alpha_1|v| + \alpha_2|\omega|)$$

3: $\hat{\omega} = \omega + \mathbf{sample}(\alpha_3|v| + \alpha_4|\omega|)$
4: $\hat{\gamma} = \mathbf{sample}(\alpha_5|v| + \alpha_6|\omega|)$
5: $x' = x - \frac{\hat{v}}{\hat{\omega}}\sin\theta + \frac{\hat{v}}{\hat{\omega}}\sin(\theta + \hat{\omega}\Delta t)$
6: $y' = y + \frac{\hat{v}}{\hat{\omega}}\cos\theta - \frac{\hat{v}}{\hat{\omega}}\cos(\theta + \hat{\omega}\Delta t)$
7: $\theta' = \theta + \hat{\omega}\Delta t + \hat{\gamma}\Delta t$
8: $\mathbf{return}\ x_t = (x', y', \theta')^T$

Examples (velocity based)

Map-Consistent Motion Model

Approximation: $p(x | u, x', m) = \eta p(x | m) p(x | u, x')$

Summary

- We discussed motion models for odometry-based and velocity-based systems
- We discussed ways to calculate the posterior probability p(x|x', u).
- We also described how to sample from p(x|x', u).
- Typically the calculations are done in fixed time intervals Δt .
- In practice, the parameters of the models have to be learned.
- We also discussed an extended motion model that takes the map into account.
